WHITMORE PARTNERS LLP COMMERCIAL DUE DILIGENCE UPDATE May 2026

SECTION 1 - MARKET EVOLUTION

Since the initial February 2026 assessment, the diligence intelligence category has seen accelerated interest from mid-market PE firms following increased pressure to shorten deal cycles and reduce analyst overhead. Whitmore Partners now estimates the addressable PE diligence intelligence market at £710–780M across Europe and North America, driven largely by increased adoption of AI-assisted workflows within investment operations teams. Interviews conducted with 11 additional PE operating partners and diligence leads suggest that the market narrative has shifted from “whether AI can be used in diligence” toward “how governance and auditability are implemented.” NovaBridge’s emphasis on structured reasoning, graph-backed evidence chains, and contradiction tracking was repeatedly identified as a differentiator relative to generic copilots and chat interfaces.

SECTION 2 - COMMERCIAL TRACTION UPDATE

NovaBridge reports that the Greenfield Capital pilot has converted into a paid annual engagement valued at approximately £82K ARR, including API access and multi-room expansion. Two additional firms — Alderwick Partners and Northshore Equity — have entered structured pilots following referrals from Greenfield. Combined pipeline visibility now exceeds £540K in active commercial discussions. We were able to independently confirm at least one production deployment operating against real transaction data within a segregated cloud environment.

SECTION 3 - PRODUCT & TECHNOLOGY DEVELOPMENT

Over the last quarter the company has materially improved the stability of its ontology extraction pipeline and introduced “Position Snapshots,” allowing diligence conclusions to be versioned over time with attached evidentiary references. The platform now supports hybrid extraction workflows combining deterministic schema enforcement with probabilistic LLM extraction passes. Technical reviewers noted this significantly reduced hallucinated entity relationships relative to earlier prototypes. We additionally note the company has reduced key-person dependency by hiring two additional ontology engineers and documenting core semantic workflows internally.

SECTION 4 - SECURITY & GOVERNANCE

Security posture has improved materially since the prior review. The company has completed external penetration testing and begun ISO 27001 readiness preparation. Several prospective customers indicated the existence of tenant-isolated deployment options substantially improved procurement confidence. NovaBridge has also introduced audit trails for reasoning lineage, evidence provenance, and user decision history — features that appear particularly attractive to regulated financial institutions.

SECTION 5 - FINANCIAL OBSERVATIONS

Management now forecasts 7 paying customers by Q1 2027 with projected ARR of £640K–£780K depending on expansion conversion. Pricing resistance appears lower than initially expected for firms evaluating the platform as an intelligence layer rather than a workflow utility. However, we still view enterprise sales velocity as the primary execution risk due to procurement timelines and data governance review cycles common in financial services.
