

NOVABRIDGE TECHNOLOGIES BOARD & INVESTOR UPDATE Q2 2026

EXECUTIVE SUMMARY

The company completed a significant transition from prototype-stage validation into early commercial deployment during the quarter. Focus areas included enterprise stability, ontology enforcement reliability, and private deployment architecture for PE clients. Customer feedback continues to validate the thesis that investment firms require structured intelligence systems rather than generic conversational AI interfaces.

KEY ACHIEVEMENTS

- Greenfield Capital converted from pilot to annual contract.
- Tenant-isolated deployment architecture completed.
- Position Snapshot framework launched internally and with pilot customers.
- First integrations with CRM and data room providers operational.
- Expanded semantic engineering team from 1 to 3 full-time specialists.

PRODUCT ROADMAP

Q3 2026 priorities include:

- Portfolio monitoring mode for ongoing company tracking.
- Automated contradiction scoring across diligence artifacts.
- Multi-agent extraction orchestration for large transaction rooms.
- IC memo generation with linked evidence provenance.
- Benchmarking layer across prior deal patterns and outcomes.

COMMERCIAL PIPELINE

The current pipeline consists primarily of UK and European mid-market private equity firms managing between £500M and £6B AUM. Management reports stronger inbound demand following customer referrals and conference demonstrations. Several firms have expressed interest in private-cloud deployment models due to confidentiality requirements.

RISKS & OBSERVATIONS

Primary risks remain enterprise procurement velocity, customer onboarding complexity, and the operational overhead associated with supporting private deployments. Competitive pressure from horizontal AI copilots is increasing; however, management believes ontology-backed reasoning and evidence traceability remain defensible differentiators.
